Maroochy Water Services

Rainwater Tank Rebate Scheme

1 Introduction

1.1 Background

Maroochy Shire Council introduced a rainwater tank rebate scheme for urban properties within the water benefited area of the shire in 1995. The objective of this rebate scheme was to encourage residents to utilise rainwater for outdoor garden watering and other external purposes, primarily as a means of reducing overall demand on the potable reticulated supply.

The eligibility conditions for the rebate include warnings to discourage the use of rainwater for drinking purposes. Council also require each installation to be vetted by a Council Plumbing Inspector to ensure there is no cross connection with the reticulated water supply scheme. A copy of the Rainwater Tank Rebate Application Form and Eligibility Conditions are included in Appendix A

Property details were recorded during the rebate application process and this information has been retained by Maroochy Water Services (MWS). MWS also have reticulated water supply consumption data for each of these properties dating back to the 1993 introduction of water meters.

Given the relatively long period this scheme has been in place MWS - with support from the Queensland Environmental Protection Agency (EPA) - decided to investigate;

- the operation and performance of installed rainwater tanks.
- the effectiveness of the rebate scheme in encouraging rainwater tank installation
- owners' perceptions about their rainwater tanks and the rebate scheme.

A program of water quality testing, tank condition assessment and resident surveys was carried out early in 2003.

1.2 Report Objectives

The key objectives of this investigation can be divided into three broad categories, as set out below;

Consumption

- Determine if rainwater tanks reduce metered water consumption
- Determine if tank size is a factor in reduced metered water consumption

Water Quality

- Determine if tank water complies with Australian Drinking Water Guidelines (ADWG)
- Identify if distance from coast affects rainwater tank salinity(TDS)
- Identify if tank condition affects water quality
- Identify if tank material affects water quality
- Check if first flush improves water quality
- Check if tank inlet screens improve water quality

Owners' Perceptions

- Compare perceived water quality versus measured water quality

-
- Identify end use of rainwater
 - Identify reasons for installing tank and the significance of the Rebate Scheme in the decision
 - Check level of satisfaction by tank owners

The above information will allow the success of the original rebate scheme objectives to be measured, and provide information on how the scheme might be revised or reviewed in order to further encourage beneficial reuse of rainwater. It also potentially addresses some of the wider issues relating to the use of rainwater tanks in urban areas.

2 Methodology

2.1 Data Collection

The resident survey, tank condition assessment and water quality testing program were developed by MWS in consultation with the EPA.

Council records indicate approximately 316 rebates have been provided since 1995.

A customer survey, a copy of which is included in Appendix B, was forwarded to each of the 316 properties. Of these, 172 were either completed, or partially completed, and returned.

Eighty-five of the 316 properties were selected for field inspections, tank condition assessment and water quality testing. These 85 properties were distributed over the water-benefited area of Shire, with locations varying from 'beachside' to 'hinterland'. A copy of the Field Inspection Report is also included in Appendix B

Single grab samples were collected from each of the tanks inspected and tested for various physical and microbiological characteristics including;

- *Conductivity*
- *pH*
- *Total Coliforms*
- *E.coli*

Sampling occurred between 14 January and 31 January 2003.

2.2 Statistical Analysis Conducted

2.2.1 ANOVA test

Analysis of Variance (ANOVA) was used to test the null hypothesis that there was no difference between the population means for identified relationships, between three or more sample sets where a normal distribution of samples could be anticipated.

The key statistic in ANOVA is the F-test of difference of group means, testing if the means of the groups are different enough to have occurred by chance.

If the group means do not differ significantly then it is inferred that the independent variable(s) did not have an effect on the dependent variable. If the F test shows that overall the independent variable(s) is(are) related to the dependent variable, then *multiple comparison tests* of significance are used to explore just which value groups of the independent(s) have the most to do with the relationship.

2.2.2 Correlation Test

The correlation analysis measures the relationship between two data sets that are scaled to be independent of the unit of measurement. The correlation analysis was used to determine whether two ranges of data move together - that is, whether large values of one set were associated with large values of the other (positive correlation), whether small values of one set were associated with large values of the other (negative correlation), or whether values in both sets were unrelated (correlation near zero).

3 Analysis Results - Consumption

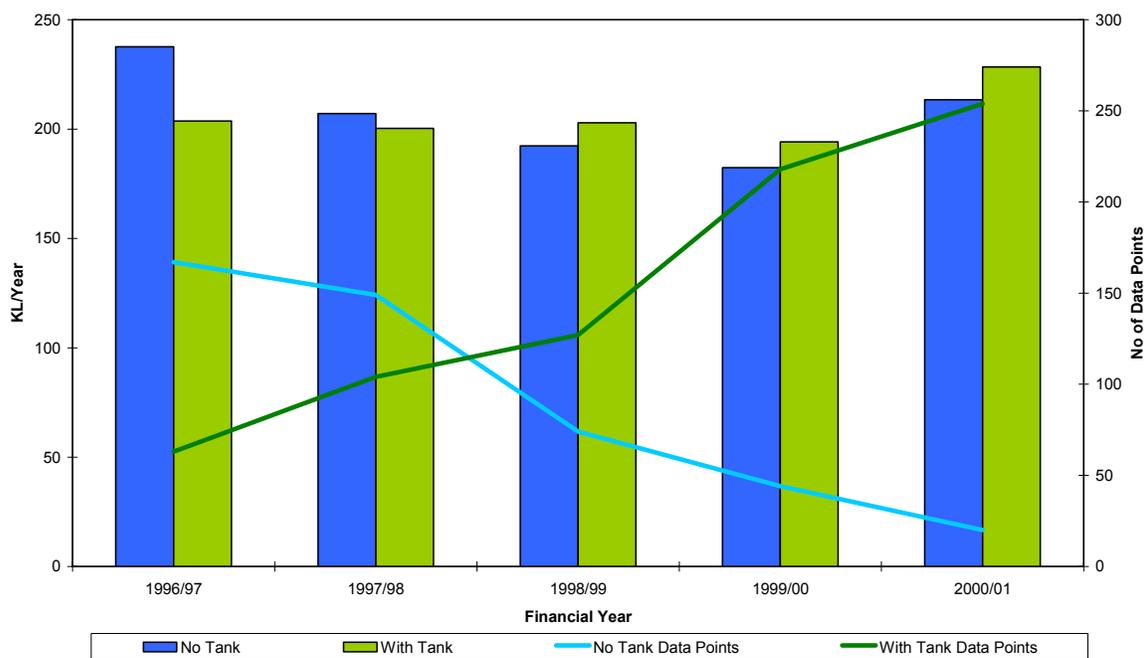

An analysis was undertaken on the following relationships to determine the effect of the parameters and their dependency on one another. The results of the statistical analysis are contained in Appendix D and are summarised below.

3.1 Presence of Rainwater Tank vs Metered Water Consumption

The objective here is to identify whether or not rainwater tanks reduce demand from the metered town supply.

A total of 316 rebates have been paid for tanks installed over the period from 1995 to 2002. Six monthly metered consumption records are also available for this period. For each year, metered consumption data for residents who had not yet installed a rainwater tank was compared with those residents who had installed a tank. The comparison is shown in Figure 1 attached.

Figure 1: Consumption Comparison for All Tanks

The comparison is made year by year, not across years. Climatic conditions, whilst they might impact on overall levels of consumption, do not affect the comparison.

Note also that the comparison is between tank owners and future tank owners. It is not a comparison between tank owners and a typical metered urban consumer. The hope here is that tank owners and future tank owners are two like-minded groups whose usage and patterns of consumption are similar. Any differences might therefore be attributable to the installation of the tank.

Figure 1 above doesn't appear to show any clear drop in metered consumption following the installation of a rainwater tank. In fact, for three of the five years compared, metered consumption was marginally higher for properties with rainwater tanks.

This is a somewhat unexpected result. However many of the tanks included in the analysis are perhaps too small to have any real impact on metered consumption. Further analysis was therefore done on larger tanks to identify if these tanks, which have greater yields and more potential for saving water, do indeed result in a reduction to metered consumption.

3.2 Tank Size vs. Water Consumption

It has been suggested that perhaps demand on the potable water supply would decrease with the installation of larger rainwater tank sizes. Figure 2 is a consumption comparison for tanks greater than 4500 litres capacity. Figure 3 is the same comparison for tanks greater than 10000 litres. As with Figure 1, the comparison is done for each year between those residents with tanks larger than the nominated size, and those who at some future date install a tank larger than the nominated size.

Figure 2: Consumption Comparison for Tanks > 4500 Litres

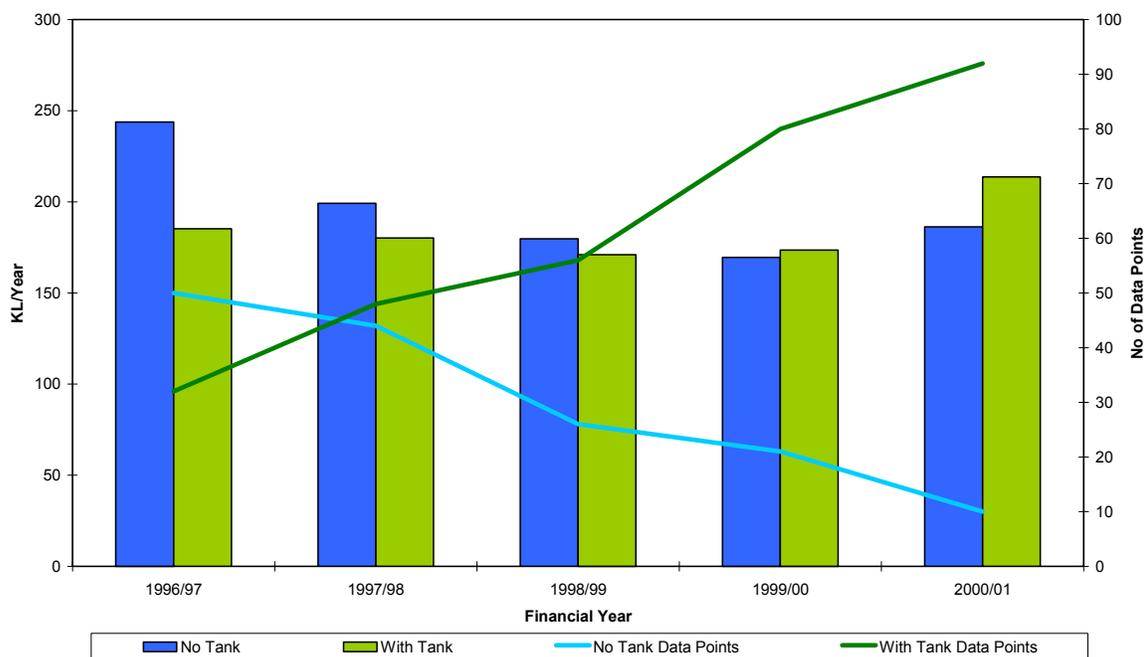

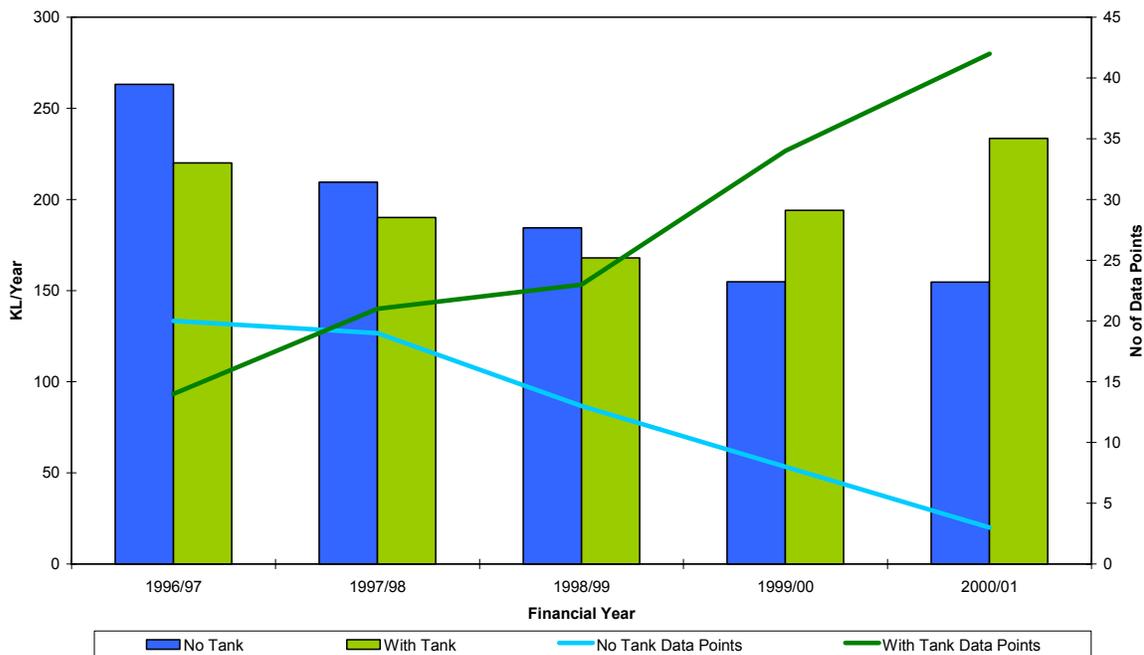

Figure 3: Consumption Comparison for Tanks > 10000 Litres

As with Figure 1, the results are still somewhat ambiguous. In the latter years, it still appears as though rainwater tanks have actually increased metered consumption. However, care should be taken with the interpretation of these results. There is perhaps too little consumption data for future 4500 L and 10000 L tank owners in the latter years – particularly 1999 onwards - to make a valid comparison. The earlier years (1996 – 1999), where the number of data points is roughly equal and where the comparison is perhaps more valid, are more suggestive of a reduction following the installation of a rainwater tank. The data from these years shows a marginal reduction in metered consumption for 4500L tanks, and a more significant reduction for the larger 10,000 L tanks.

4 Analysis Results – Water Quality

4.1 Rainwater Tank Quality

The ADWG state that the microbiological quality of drinking water should be tested against two indicator organisms; thermotolerant coliforms, or alternatively *E.coli* and total coliforms. To comply with the drinking water guidelines, no sample should contain any *E.coli* or coliform organisms.

In addition to the microbiological quality parameters, the ADWG also specify limits to a host of physical characteristics. Relevant to the samples collected from the rainwater tanks for this investigation is pH (6.5 – 8.5¹) and TDS (500 mg/L).

Ninety-two samples were collected from selected rainwater tanks installed as part of the rainwater tank rebate scheme. Of the 92 samples all were assessed for *E.coli*, total Coliforms and pH with TDS measured for 42 of the samples.

Sixty-seven of the 92 samples or 73% analysed for *E.coli* comply with the standards however only 11 of the 92 samples, or 12%, comply with the coliform standard. Furthermore whilst all of the samples complied with the TDS standard, only 39% met the pH requirement. Overall only 5 out of the 92 tanks sampled met the ADWG for the analysed parameters.

On this basis it would appear that the warning provided in the Rebate Eligibility Conditions regarding the unsuitability of rainwater tanks as a source of drinking water is warranted.

It is perhaps also worth comparing the measured rainwater tank quality with the recently released Draft Queensland Guidelines for the Safe Use of Recycled Water. These Guidelines cover the use of roof water harvested and stored in rainwater tanks in urban areas. In particular, the Draft Guidelines note that;

“Rainwater used for non-potable domestic purposes should always meet Class A standard, although a chlorine residual would only be required if microbiological contamination is likely. If this standard is not met for raw rainwater, disinfection will be required to achieve this standard.”

Class A Standard has a median microbiological requirement of not more than 10 thermotolerant coliforms (cfu’s) per 100 ml. Sampling results indicate 9 out of the 92 samples tested had thermotolerant *E.Coli* levels equal to or higher than this Class A Standard. Although individual test samples are not directly comparable with a median test requirement, the results do flag the possibility that without disinfection, some rainwater tanks may not be suitable for non-potable domestic use under the current Draft Guidelines.

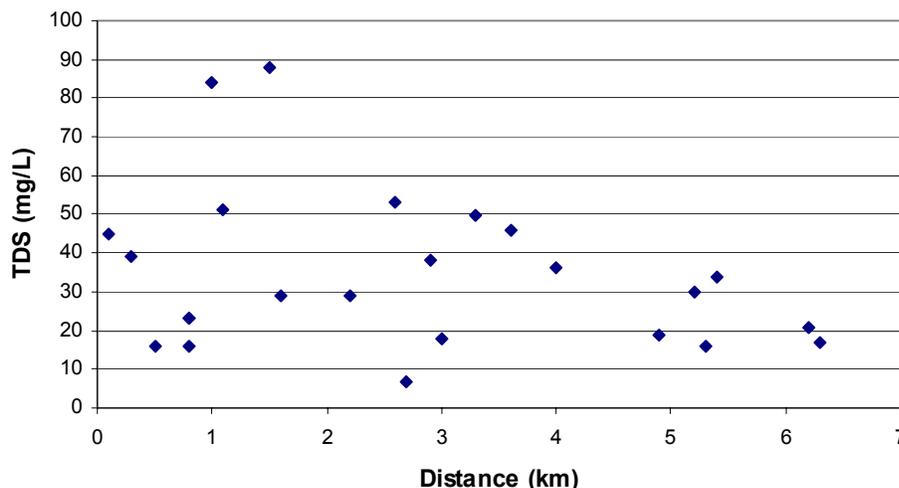

4.2 Distance from Coast vs. TDS

Given the proximity to the coast of a number of the rainwater tank installations, concerns were raised that salt spray may be adversely affecting the quality of water collected in these areas.

TDS analysis was undertaken on 42 rainwater tanks with the results from the tests plotted against the approximate distance from the coastline.

¹ Concrete tanks can significantly increase the pH and a value up to 9.2 may be tolerated provided there is no decrease in microbiological quality (relevant to chlorination)

Figure 4: Distance from Coast versus TDS

A qualitative analysis of the graph indicates that there is a possible weak negative correlation between distance from the coast and TDS. This is of little concern given the relatively low levels of TDS recorded.

4.3 Tank Material versus Water Quality

The influence of tank material on water quality was assessed to identify any relationships. Under the rebate scheme there is no specific requirement for the type of tank material to be used. Respondents have installed concrete (8%), fibreglass (10%), galvanised (36%) and polyethylene (40%) tanks, with the remaining 6% tank material types not listed.

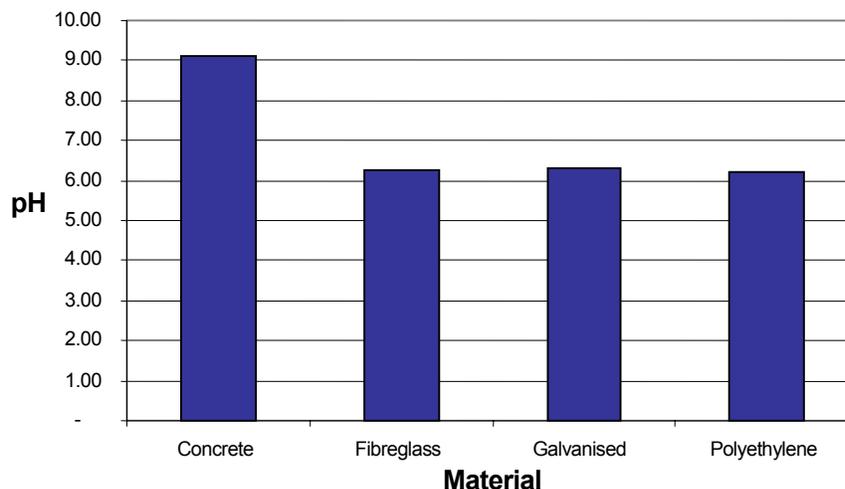

It was anticipated that there would be some relationship between tank material and pH, as it is known that concrete tanks are alkaline in nature. However the relationship between the other tank materials and the measured water quality parameters was checked.

ANOVA was used to test null hypothesis of no statistical difference between the water quality parameters measured and the tank material. The following was identified:

- pH Statistically significant difference
- Total Coliforms No difference
- E. coli No difference
- TDS No difference

When pH measurements were compared for each of the tank materials considered, it can be seen that the pH of the concrete tanks was higher than that of the remaining tanks, indicating an alkaline tendency. Whereas the fibreglass, galvanise and polyethylene tanks all recorded similar, relatively neutral pH levels.

Figure 5: Tank Material versus Average pH

As such it can be identified that a relationship does exist between pH and tank material, though only for concrete tanks. The water quality appears to be independent of the tank material for all other characteristics.

4.4 First Flush System versus Water Quality

It was assumed that the installation of a first flush system on the tank would minimise the level of potential contaminants entering the tank and deteriorating the quality of the water.

During the survey those tanks with a first flush device were noted. The water quality results obtained during the tank sampling were then compared between tanks with and without first flush devices.

Statistical analysis tested the null hypothesis that there was no difference between the quality of waters where a first flush device was installed and those where such a device was not installed. Analysis confirmed that there is no statistically significant difference between the parameters measured with or without first flush devices. The analysis identified:

- pH No difference
- Total Coliforms No difference
- E. coli No difference
- TDS No difference

It should be noted that sampling of waters was carried out during a sustained dry period, prior to the onsite of summer rains. The effectiveness, therefore, of a first flush device is difficult to verify. Although the first flush device does not appear to be making any difference in the microbiological quality of the water, this is only true for the status of the tank at the end of this dry period. A first flush device may well show some discernible impact on water quality if sampling were conducted in the immediate aftermath of a rainfall event.

4.5 Tank Inlet versus Water Quality

During the rainwater tank survey, the level of blockage of the inlet screen was noted. A percentage of 0, 25, 50, 75 or 100 per cent was applied to each tank. This was based on the surveyor's perception of the blockage.

Consideration of the relationship between blockage of the inlet screen and therefore the ability to screen water prior to entry of the tank and water quality was assessed.

Statistical analysis between the various parameters and the level of blockage identified that there was no statistically significant difference in water quality. As such it could be assumed that there is no relationship between the condition of the tank inlet/level of blockage and water quality.

4.6 Tank Condition versus Water Quality

Eleven of the 97 tanks surveyed were noted as exhibiting exterior deterioration. Of these eleven tanks, seven (64%) were galvanised tanks, 2 were concrete and the remaining 2 were fibreglass and polyethylene, respectively. The galvanised tanks exhibiting deterioration were noted as showing evidence of rusting. Other deterioration noted within the survey included cracks, leaks and flaking paintwork.

Statistical analysis of the parameters measured and deterioration of the tank, with a null hypothesis of "No Difference in Means" has identified that there is no relationship between deterioration of the tanks sampled and water quality.

4.7 Tank Condition versus Primary Owner

An assessment was undertaken to identify whether a change in ownership may influence the maintenance of the rainwater tanks installed and therefore the rate of deterioration of the tank.

Respondents to the rainwater tank rebate scheme survey were asked whether they were the initial owner of the tank or whether a previous owner had installed the tank. Of the 97 tanks surveyed, only 5 had been installed by a previous owner.

Of the 97 tanks surveyed, eleven (11%) showed signs of deterioration. Only 1 of these tanks had been installed by a previous owner. From this information it could be assumed that there is no relationship between deterioration and tank owner.

Additional statistical analysis was not undertaken due to the limited number of observations.

5 Analysis Results – Owners’ Perceptions

The objectives of this part of the analysis were as follows;

- Compare perceived water quality versus measured water quality
- Identify reasons for installing tank and the significance of the Rebate Scheme in the decision
- Identify end use of rainwater
- Check level of satisfaction by tank owners

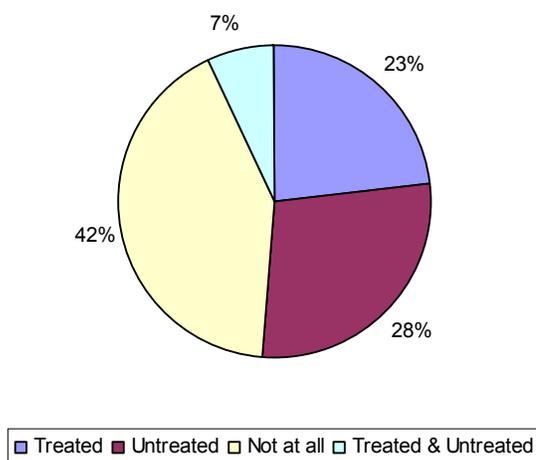

5.1 Perceptions of Rainwater Tank Quality

Despite the requirements outlined in the application for the rebate that rainwater tanks be used for outdoor purposes only, it has long been suspected that a large number of the residents claiming the rebate were using the water for drinking purposes.

Part of the rainwater tank survey distributed to the residents focused on the uses of the water from the tank and their perceptions of the safety of treated and untreated water used from a rainwater tank.

As indicated in Figure 6 below, 58% of the survey respondents used the rainwater tank for drinking water in the home, either treated in some manner such as filtration - or untreated, or both.

Figure 6: Drinking Water Use

When asked whether or not they were satisfied with the level of water quality provided by their rainwater tank, the overwhelming majority of respondents, approximately 90%, indicated that they were satisfied.

It is of interest that the majority of tank owners believe tank water is safe to drink, despite warnings to the contrary made in the rebate application process.

The fact that most rainwater tanks are used for drinking purposes may help explain why such tanks appear to have little impact on metered consumption. Rainwater tanks need to be fully utilised, i.e. regularly drawn down, if the full potential of their available yield is to be realised. However, residents who utilise rainwater as their potable source are perhaps more inclined to hoard their supply to carry them through dry periods.

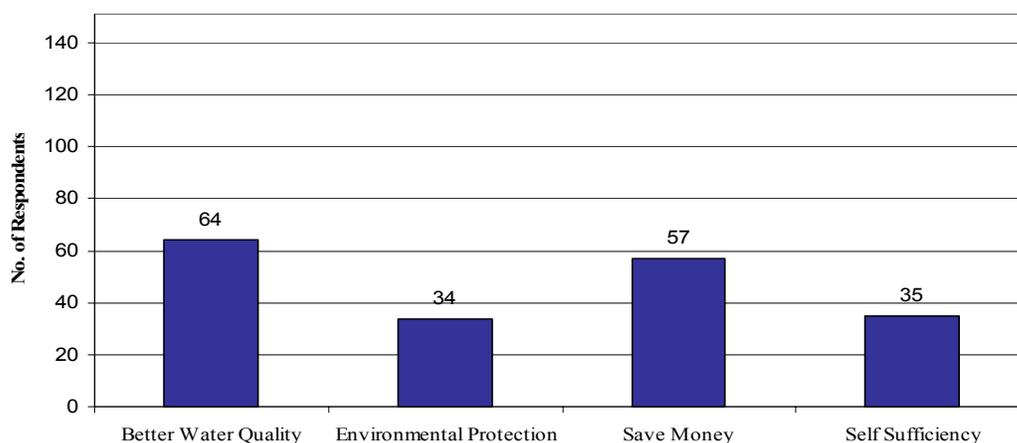

5.2 Reason for Installing Tank

The survey questionnaire asked residents why they installed a rainwater tank and provided a list of possible answers, including;

- Better Water Quality
- Environmental Protection
- Save Money
- Self – Sufficiency

Most residents indicated a combination of the reasons above. A breakdown of the number of responses for each is given below;

Figure 7 Reasons for Installing Rainwater Tank

It appears the more important factors influencing decisions to install rainwater tanks are perceptions of improved water quality and the potential to save money.

The questionnaire went on to ask residents;

- Are you satisfied with water quality? - to which 90% responded “Yes”
- Have you noticed a change in consumption? – to which 70% responded “No”

It is interesting to note that – in general - respondents are well satisfied with the water quality they receive from rainwater tanks. However, in relation to potential savings in metered consumption and costs, 70% have not been able to detect any decrease in consumption. This failure to detect any reduction supports the analysis findings of metered consumption made in Section 3 above.

Despite the fact that most residents have not noticed any reduction in consumption, a majority - approximately 84% - indicated they believed the rainwater tank was a worthwhile investment.

5.3 Significance of Rebate Scheme

The survey questionnaire asked residents to indicate how the rebate provided by Maroochy Shire Council influenced their decision to purchase a rainwater tank. The following responses were provided;

Options	Responses
<input type="checkbox"/> I would not have purchased a tank without the rebate	5%
<input type="checkbox"/> The rebate allowed me to purchase a larger tank	16.5%
<input type="checkbox"/> The rebate motivated me to buy the tank	22.5%
<input type="checkbox"/> I would have installed a rainwater tank without the rebate	56%

For almost half the respondents, the rebate scheme was a factor in their decision to install a rainwater tank.

In relation to the value of the rebate, the questionnaire asked what rebate ought to be offered to other residents to encourage greater uptake of rainwater tanks? The following responses were provided;

Options	Responses
% of the total cost of the rainwater tank:	
<input type="checkbox"/> 0% (No Rebate)	5%
<input type="checkbox"/> 10%	30%
<input type="checkbox"/> 25%	39%
<input type="checkbox"/> 50%	26%

Of most interest is the fact that respondents tended to favour a moderate rebate scheme in the order of 10% – 25%.

5.4 End use of Rainwater

The survey questionnaire asked residents to detail how tank water was used. Residents were asked to provide details on both internal and external uses.

Six of the 172 respondents who completed or partially completed the survey questionnaire indicated that they do not use their tanks at all. Note that this probably understates the percentage of non-using residents, since there is presumably a higher proportion of non-users amongst the remaining 144 residents who failed to complete the questionnaire.

Of the 160 respondents who completed the section of the questionnaire detailing tank water use, 63 use rainwater exclusively for internal use, i.e. drinking, cooking etc, with 41 respondents indicating exclusively external use, i.e. garden watering, car washing, etc. A further 45 respondents use rainwater for both internal and external uses.

Figure 8 presents the number of respondents who use rainwater for particular internal uses. Figure 9 presents a breakdown of external use.

Figure 8- Internal Use by Number of Respondents

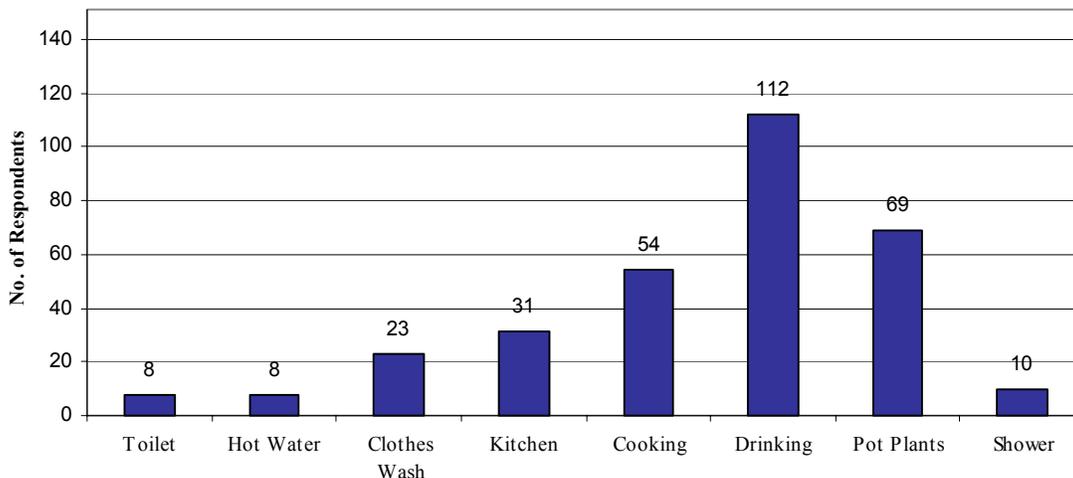

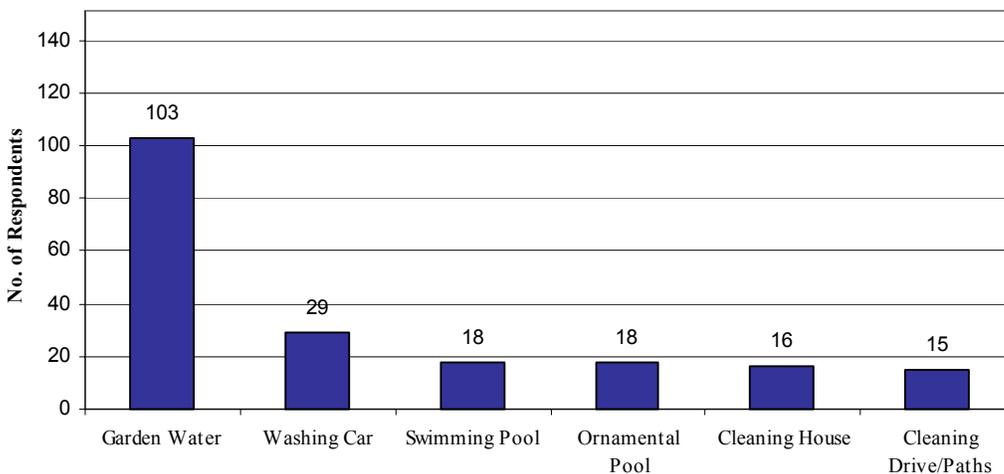

Figure 9 – External Use by Number of Respondents

The above figures suggest that rainwater tanks are predominately used for drinking and garden watering.

5.5 Level of satisfaction by tank owners

The survey questionnaire included a series of questions aimed at gauging the level of satisfaction by tank owners. These questions and their results are summarised below,

Are you satisfied with the quality of the water from your tank?

Options	Responses
<input type="checkbox"/> Yes	90%
<input type="checkbox"/> No	10%

Are you satisfied with the size of your rainwater tank?

Options	Responses
<input type="checkbox"/> Yes	65%
<input type="checkbox"/> No	35%

Have the outcomes you expected to achieve through installation of a rainwater tank been met?

Options	Responses
<input type="checkbox"/> Yes	82%
<input type="checkbox"/> No	18%

Having now owned and operated a rainwater tank, was it a worthwhile investment?

Options	Responses
<input type="checkbox"/> Yes	84%
<input type="checkbox"/> No	16%

Overall, 84% of residents are happy with their investment in a rainwater tank. However, given that the sample group comprises people who wanted and initiated the installation of a rainwater tank, the level of dissatisfaction – about 1 in 6 - is perhaps significant.

It is also worth noting that approximately 35% of residents are dissatisfied with the size of their tank. When queried further, almost all these residents indicated that they would prefer a larger tank.

6 Conclusions

The review of Maroochy Water Services Rainwater Tank Rebate Scheme has identified a number of key issues that need to be considered in any assessment of the rebate scheme. These are summarised below.

Consumption

Overall, the evidence at hand indicates no significant reduction in metered demand arising from the installation of rainwater tanks under the current rebate scheme. There is some evidence that larger tanks, 4500 L and greater, do provide a marginal reduction in metered consumption.

The lack of any clear unambiguous reduction in consumption arising from the rebate scheme is somewhat surprising. However, care should be taken with these results. A close review of the individual property data shows many instances where consumptions rise dramatically following the installation of a rainwater tank. There are a number of possible explanations for this. Tanks may be installed as part of process whereby a holiday home becomes a permanent residence; new owners with much higher water usage requirements purchase the property and install a tank; current property owners install a tank as part of renovation involving landscaping and irrigation which ultimately results in an increase to their metered consumption, etc. Although similar circumstances can be envisaged that also lead to a dramatic reduction in demand following a rainwater tank installation, it is difficult to determine whether or not within the data set available, the affect of these differing circumstances negate one another. Any asymmetry in the number and impact of these differing circumstances will tend to skew the data.

Leaving aside uncertainties with the data, it is questionable whether or not many of the rainwater tanks installed under the current rebate scheme are sufficiently sized to achieve a significant yield. Furthermore, it is also unlikely that many of the tanks are being used in a manner that would result in a measurable reduction in metered consumption. Tanks need to be drawn down as much as possible to achieve the full potential of their available yield. Survey results suggest about 60% of tank owners utilise rainwater for potable supply. These consumers are perhaps less inclined to frequently empty their tanks for garden watering and other high demand non-potable purposes.

Under the present rebate scheme, residents are free to determine the size of their tank and the purposes for which it is used. There is no particular inducement to encourage residents to connect tank supply to high demand non-potable uses which would better utilise the yield available.

If the ultimate intention is that rainwater tanks should lead to a reduction in metered consumption, requirements governing the size of the tank and its connection to high demand non-potable uses may need to be mandatory.

Water Quality

Approximately 95% of the tanks sampled failed to meet the Australian Drinking Water Guidelines with respect to microbiological quality. The warnings given to rebate applicants by MWS in relation to the use of rainwater for drinking purposes are therefore considered appropriate.

Approximately 10% of tanks sampled had an E.coli count higher than the Class A Standard required under the recently released Draft Queensland Guidelines for the Safe Use of Recycled Water. This suggests the possibility that without disinfection, some rainwater tanks may not be suitable for non-potable domestic use.

The evidence at hand indicates that first flush devices, inlet screens and routine maintenance have little impact on water quality.

A weak correlation exists between distance from the coast and the level of TDS present in tank water. The result is of little significance since TDS levels, even close to the coast, were all well below drinking water limits.

Owners Perceptions and Usage

At present, the two major reasons why residents install rainwater tanks appear to be;

- Improved water quality
- Saving money.

In terms of water quality, tank users are well satisfied and believe their tank water is suitable for drinking. This is despite warnings to the contrary issued during the rebate application process. However, in relation to potential savings, most rainwater tank users (70%) have been unable to notice any impact on their metered consumption.

Almost half the respondents indicated that the current rebate scheme influenced their decision in relation to rainwater tanks, either as a motivation to proceed or to increase the size of the tank. Most respondents thought the scheme should involve a rebate in the 10% – 25% range.

The predominate uses of rainwater are for drinking and garden watering.

Overall, 84% of residents are happy with their investment in a rainwater tank. However, given that the sample group comprises people who wanted and initiated the installation of a rainwater tank, the level of dissatisfaction – about 1 in 6 - is perhaps significant.

It is also worth noting that approximately 35% of residents are dissatisfied with the size of their tank. When queried further, almost all these residents indicated that they would prefer a larger tank.

7 Acknowledgements

Maroochy Water Services (MWS) gratefully acknowledge the financial assistance and support provided by the Queensland Environmental Protection Agency (EPA) towards this investigation. MWS would also like to thank those residents who co-operated with this investigation by completing survey questionnaires and making their tanks available for inspection and testing.

APPENDIX A

Rainwater Tank Rebate Application Form and Eligibility Conditions

RAINWATER TANK REBATE APPLICATION FORM

THIS IS A LIMITED OFFER

Details of the offer . . .

Maroochy Shire Council will pay a rebate as follows to a **limited number of residents** in the Shire's reticulated water areas who install a rainwater tank on their premises **IN THE CURRENT FINANCIAL YEAR.**

To apply for your rebate, fill in the details below and return this form *along with a receipt from the store of purchase* to:

The WaterWise Coordinator – PO Box 658 Maroochydore Qld 4558 or deliver to Maroochy Water Services 11-13 Ocean Street, Maroochydore.

TANK SIZE:	99-999L	1,000-2,499L	2,500-4,499L	4,500-9,999L	10,000L +
REBATE:	\$20.00	\$40.00	\$80.00	\$175.00	\$250.00

Surname and initials: Mr/Mrs/Ms _____

Street Name and Number: _____ Suburb: _____ Postcode: _____ Telephone: _____

Property No. as listed on Rates Notice: _____

Details of rainwater tank purchased....

Size: _____ Purchase Price: _____ Store of Purchase: _____ Date of Purchase: _____

I heard about the Rainwater Tank Rebate Program from: (please circle)

- | | | | |
|----------------------------|-------------------|--------------------------------------|-----------------|
| ◆ Brochure in Rates Notice | ◆ Newspapers | ◆ Local Store | ◆ Local Plumber |
| ◆ Television | ◆ Community Group | ◆ Water Conservation Rebate Bulletin | ◆ Word of Mouth |

Are you considering installing any other water efficient products? Yes No If yes what type? _____

In applying for this rebate, I hereby give approval for Council Officers to inspect the installation of the rainwater tank at my home to ensure that it has been installed correctly.

☞ PLEASE SEE REVERSE FOR ELIGIBILITY CONDITIONS

Applicant's Signature

For more information, please contact the WaterWise Coordinator on 5475 8705

RAINWATER TANK REBATE ELIGIBILITY CONDITIONS

1. The scheme is open to people living in a new or existing residence which is part of the reticulated water system of Maroochy Shire Council.
2. Rainwater tanks should only be used for outdoor purposes and shall not be cross connected with the reticulated water system. (Untreated rainwater tanks should not be used as a drinking water source because of potential water quality problems due to atmospheric pollution, bird and possum droppings, roofing materials and paints, trapped insects and small animals, leaves and dust and inconsistent owner operation and maintenance.)
3. Rebates are only payable on tanks purchased and installed in the current financial year.
4. This offer is strictly limited. Once the designated number of rebates for the current financial year have been issued, there will be no more rebates. The program MAY continue into the following financial year.

NOTE:

ALL participants in the Rainwater Tank Rebate Program will have their installation inspected by Council plumbing staff to ensure correct installation of the tank and to confirm NO cross connection with the reticulated water system occurs.

Water . . . more precious than gold! Make the effort. Conserve water now!

Appendix B

Customer Survey and Field Inspection Report

- For 'Yes / No' answers, please circle your answer.
- For selections with boxed answers () please *tick* the appropriate boxes.
You may have more than one response to a question.
- For written answers, please try to respond as clearly and briefly as possible.

1. Our records indicate that you have a rainwater tank obtained under the Maroochy Water Services' rebate scheme.

Is this tank still operational? **Yes / No**

If **No**, why is tank no longer operating?

- Inconvenience
- Loss of interest
- Faulty tank
- Other reason (specify) _____

*If you answered **No** to question 1 stop here, as you are not required to complete the remainder of the survey. Thankyou.

2. Did a previous owner install the tank? **Yes / No**

If **Yes**, go to question 7.

If **No**, why did you install the tank?

- Better water quality
 - Environmental protection
 - To save money (on water bills)
 - To obtain self sufficiency
 - Other (please specify)
- _____
- _____

3. Have the outcomes you expected to achieve through installation of a rainwater tank been met? **Yes / No**

4. How did the rebate provided by Maroochy Shire Council influence your decision to purchase a rainwater tank?

- I would not have purchased a tank without the rebate
- The rebate allowed me to purchase a larger tank
- The rebate motivated me to buy the tank
- I would have installed a rainwater tank without the rebate

5. What rebate do you think ought to be offered to other residents to encourage greater uptake of rainwater tanks?

% of the total cost of the rainwater tank:

- 0% (No Rebate)
- 10%
- 25%
- 50%

6. Have you noticed a change in your metered water usage since installing and using the rainwater tank?

Yes / No / Do not know

If **Yes**, has it: -

- Increased
- Decreased

By approximately how much? _____ % or _____ kL/ 6 months
(either % or kL is acceptable)

7. Having now owned and operated a rainwater tank, was it a worthwhile investment? **Yes / No**

If **Yes**, main benefit was

- Environmental protection
- Better water quality
- Reduced expenses
- Other (specify) _____

If **No**, main concern was

- Inconvenience
- Cost
- Poor water quality
- Other (specify) _____

8. Are you satisfied with the size of your rainwater tank? **Yes / No**

If **No**, would you rather it be:

- Smaller
- Larger

Preferred size: _____ L (or _____ Gallons)
(please provide volume)

9. What do you use tank water for inside the house?

- | | |
|--|--|
| <input type="checkbox"/> Nothing | <input type="checkbox"/> Drinking- treated
(including boiled) |
| <input type="checkbox"/> Toilet flushing | <input type="checkbox"/> Drinking- untreated |
| <input type="checkbox"/> Hot water | <input type="checkbox"/> Watering plants |
| <input type="checkbox"/> Clothes washing | <input type="checkbox"/> Showering |
| <input type="checkbox"/> General kitchen use | |
| <input type="checkbox"/> Cooking | |
| <input type="checkbox"/> Other (specify) _____ | |

19. How often do you maintain the device?

Tank Inlet Screen:

- Never
- Once every 5 years
- Once every 2 years
- 1 time/year
- 2 times/year
- More often than 2 times/year
- Other frequency (*specify*) _____

Leaf/Gutter Guard:

- Never
- Once every 5 years
- Once every 2 years
- 1 time/year
- 2 times/year
- More often than 2 times/year
- Other frequency (*specify*) _____

Leaf Catcher/Diverter:

- Never
- Once every 5 years
- Once every 2 years
- 1 time/year
- 2 times/year
- More often than 2 times/year
- Other frequency (*specify*) _____

20. How often do you clean your gutters?

- Never
- Once every 5 years
- Once every 2 years
- 1 time/year
- 2 times/year
- More often than 2 times/year
- Other frequency (*specify*) _____

21. How often do you clean your tank?

- Never
- Once every 5 years
- Once every 2 years
- 1 time/year
- 2 times/year
- More often than 2 times/year
- Other frequency (*specify*) _____

Thank you for your time, your participation is greatly appreciated.

-Rainwater Tank Field Results-

Date of Visit: ___/___/___

*Property No: _____

*Owner Name: _____

*Tank Size: _____

*Tank Age: _____

Tank Material: **Galvanised, Concrete, Polyethylene, Fibreglass.**

Does the tank show signs of deterioration? **Yes / No**

What signs does it exhibit?

- Cracks
- Leaks
- Holes
- Repairs

Comments:

What condition is the guttering in? **Poor/Satisfactory/Good**

Comments:

Evidence of staining: _____

Are there overhanging trees/shrubs? **Yes / No**

Extent: _____

What is the extent of any accumulation of leaf litter in and around the guttering?

- Gutters are completely clean and free of litter.
- Some leaf litter present but generally well maintained.
- Gutters have a substantial amount of leaf litter present.
- Gutters are completely blocked by leaf litter.

Comments:

Inlet screen % blocked: **0% 25% 50% 75% 100%**

Estimated catchment area: _____ m²

Tank capacity filled

10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

Is there a first flush device? **Yes / No**

What condition is it in?

- Well maintained
- Partial accumulation in catchment
- Considerable accumulation in catchment

Comments:

What other components are noticeable?

- Filters
- Pump
- Connected to town water
- Leaf/Gutter Guard
- Leaf Catchment

Condition of components

1. _____ **Poor/Good/Excellent** Comment: _____
2. _____ **Poor/Good/Excellent** Comment: _____
3. _____ **Poor/Good/Excellent** Comment: _____
4. _____ **Poor/Good/Excellent** Comment: _____
5. _____ **Poor/Good/Excellent** Comment: _____

Condition of mosquito proofing

- Absent
- Significant areas with mosquito proofing material absent
- A few minor tears and/or holes
- Optimal condition

Comments:

Observation of the Water Sample

Sample colour: _____

Presence and extent of sediment: **Y / N** _____

Odour: _____

Mosquito Larvae: **Yes / No**

Further Comments:

Sample number: _____
No. samples taken: _____
Time sample was taken: _____
Time of delivery to laboratory: _____

Revisit
